The screenshot shows the Visual Studio Code editor with the `PlayerRespawn.cs` script open. The script is a C# MonoBehaviour class that handles player respawning and damage events. The code includes using statements for `System.Collections`, `System.Collections.Generic`, `UnityEngine`, and `UnityEngine.SceneManagement`. It defines private variables for checkpoint positions and a public Animator reference. The `Start()` method checks for saved checkpoint positions and sets the player's initial position. The `ReachedCheckPoint()` method updates the checkpoint positions. The `PlayerDamaged()` method triggers a hit animation and loads a new scene.

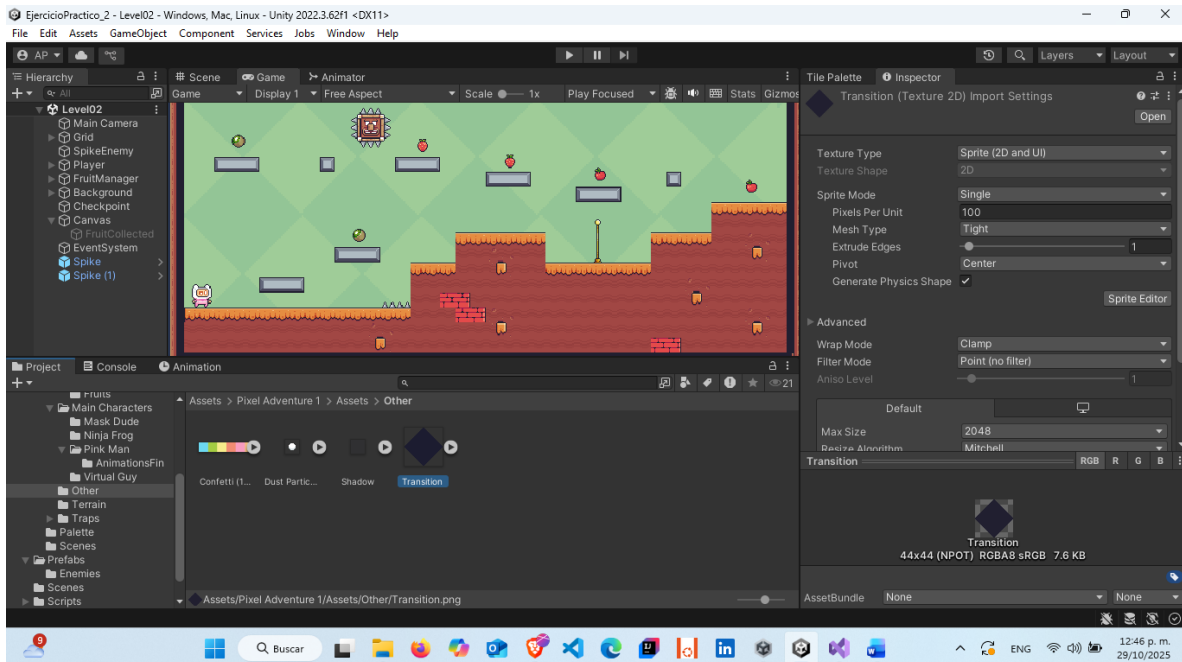

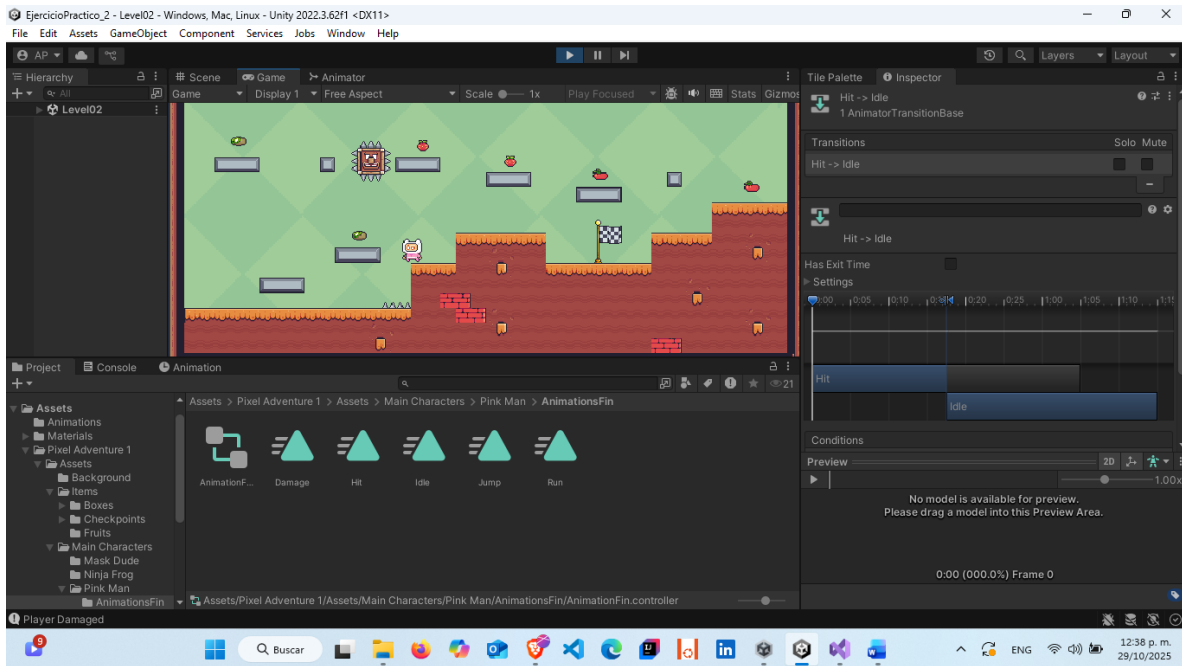

```
1 using System.Collections;
2 using System.Collections.Generic;
3 using UnityEngine;
4 using UnityEngine.SceneManagement;
5
6 public class PlayerRespawn : MonoBehaviour
7 {
8     private float checkPointPositionX, checkPointPositionY;
9     public Animator animator;
10
11     void Start()
12     {
13         if (PlayerPrefs.GetFloat("checkPointPositionX") != 0)
14         {
15             transform.position = (new Vector2(PlayerPrefs.GetFloat("checkPointPositionX"), PlayerPrefs.GetFloat("checkPointPositionY")));
16         }
17     }
18
19     public void ReachedCheckPoint(float x, float y)
20     {
21         PlayerPrefs.SetFloat("checkPointPositionX", x);
22         PlayerPrefs.SetFloat("checkPointPositionY", y);
23     }
24
25     public void PlayerDamaged()
26     {
27         animator.Play("Hit");
28         SceneManager.LoadScene(SceneManager.GetActiveScene().name);
29     }
30 }
